

NFX FOR MSP SOLUTION BRIEF

# Managed Logging Solutions

nFX Cinxi | One™

## Logging-as-a-Service for Security, Operations and Compliance

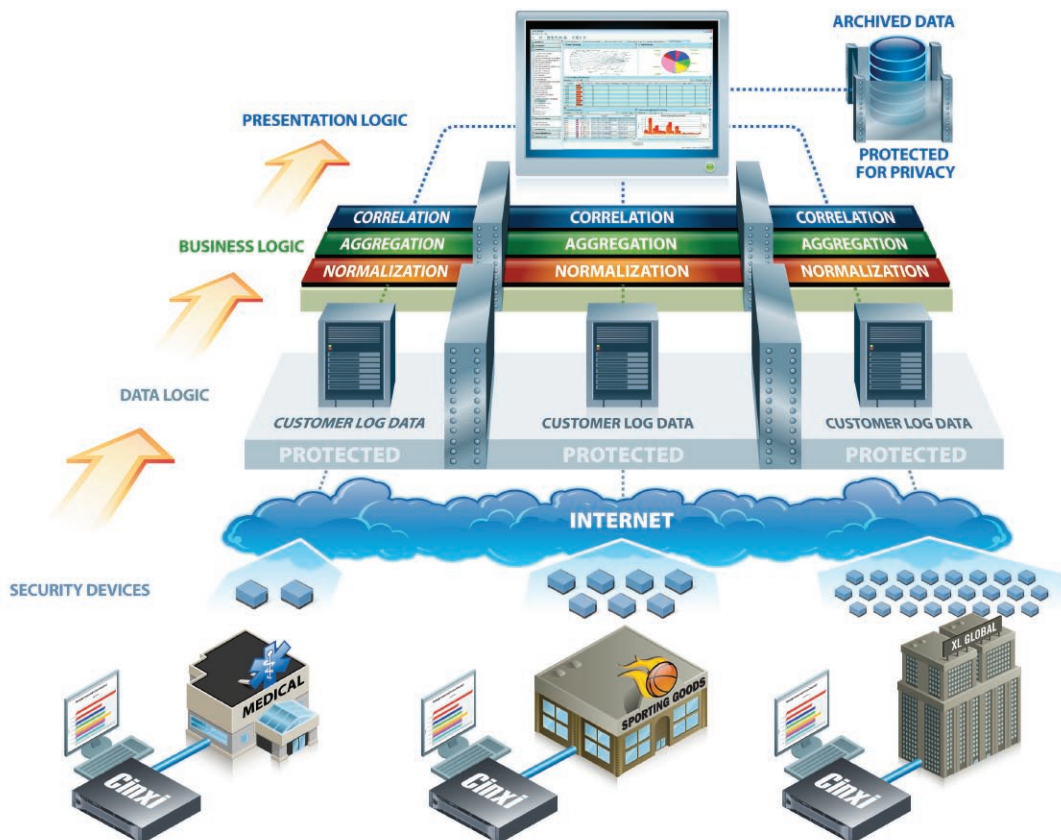

Increasingly complex regulatory compliance mandates, corporate policies and the desire for customers to have local control of secure event data are driving the demand for local log management solutions on their networks. With nFX One in your security operations center and netForensics Cinxi One appliances at your customer premises, you have the power to deliver logging-as-a-service to meet their needs.

### For managed service providers, nFX's managed logging solutions deliver:

- Lower costs using our packaged and pre-configured customer premise equipment (CPE) product
- Increased customer value with local/on-premise log file retention and management
- Low-cost "on-boarding" of customers to a greater security and/or compliance service
- Easily expandable platform for additional security and compliance services

Cinxi appliances are quick and easy to set up on physical segments or remote customer sites. Each Cinxi collects, signs, encrypts and stores event logs from a broad array of security and network devices. Important security events from these logs are also forwarded to your central nFX One platform where they are aggregated and enriched through an array of correlation technologies. Once the data has been classified and prioritized, it is presented in a "single pane of glass" view that your team can easily understand and proactively manage. Operators can instantly identify and mitigate threats, system breaches or policy violations anywhere across the network, or in your customer's environments.

The nFX One platform also gives MSP security teams great flexibility in managing remote Cinxi appliances. Cinxi appliances are managed and configured centrally by nFX One, giving your team total control and clear visibility into the activities at each customer site. An intuitive rules framework makes it easy to create and distribute rules locally or globally. And with the industry's most comprehensive set of security management tools, operators can perform in-depth analysis, alerting, reporting and incident remediation on all events across all remotely deployed Cinxi units. Additionally, local Cinxi users have access to their log file research, management and compliance reporting.

With the integration of nFX One and Cinxi you can:

- Get end-to-end visibility for all security related events across customer data networks from your central nFX One console
- Add an unlimited number of Cinxi appliances tied to your central nFX One platform
- Set up distributed or localized secure event logging to solve regulatory governance
- Control access to Cinxi functionality, including the ability to add, monitor and report on logs at customer premises
- Selectively choose which Cinxi devices forward events to nFX One
- Locally or globally search, manage and report on logs stored on any Cinxi device
