

NFX FOR MSP SOLUTION BRIEF

SP Detect™

Identify and Stop Threats *Before* They Impact Your Customer

Botnets, worms, malware and hackers are highly dynamic and constantly evolving. The most challenging task any MSP security expert faces is identifying these threats and, most importantly, eliminating them as soon as possible. How can your security team stay on top of this constantly shifting battlefield? The first line of defense is understandable, actionable security intelligence and an automated means of collecting, analyzing and prioritizing threat data.

SP Detect proactively monitors your customers' networks for global threats and all types of malicious activity. Your team finally has the intelligence they need to minimize risk and defend valuable assets. And when attacks do occur – they can take action before any real damage occurs. SP Detect dynamically collects a broad depth and breadth of global threat information from a myriad of live threat profiling sources across the Internet and applies sophisticated correlation analysis to provide you with actionable threat intelligence.

Unlike other technologies that merely take in live feeds, nFX correlation enhances data on known and evolving threats with data specific to your environment and automatically enriches it to make it even more relevant to your users. It's the difference between generic and specific protection.

nFX One gives MSPs the agility and power they need to confidently grow their security services business.

Armed and ready to meet the challenges of security in the cloud, nFX One is the only technology designed to handle the complexity of collecting, correlating and processing security events across multi-tenant environments. nFX One gives both you and your customer understandable, actionable security intelligence. Other nFX One benefits include:

- **Robust, multi-tier architecture that easily scales for growth**
- **Unparalleled visibility across all customer environments**
- **Identifies the most stealth external or internal threats**
- **Reduces volumes of security noise, identifying true threats**
- **Proactively monitors customer sites to help stop attacks in their tracks**
- **On-demand reporting , real-time alerting and incident management**
- **Meets customer demands for compliance, audit and governance reporting**

Monitor. Detect. Inspect. Comply. *The full suite of nFX One SP solutions act as an integrated platform to give you and your customers a full range of security and compliance options. Implement only the modules you need. Add functionality as you grow. Every module is time-tested in data centers and MSP SOC's around the world. Now you can offer top-tier security services with confidence and expand your service business with little up-front cost or extensive training.*

Differentiate Your Offerings with Global Threat Services

The SP Detect module lets you offer unique, yet highly valued services that position your portfolio of offerings head and shoulders above your competitors. By adding this powerful layer of threat detection, you can expand your line of services with proactive security intelligence that helps protect your customers brand and critical data.

SP Detect puts your team in control as it:

- Provides clear visibility into emerging threats and zero-day attacks even if no attack signature or published exploit yet exists
- Tracks intruders from dynamic global threat profiling sources to defend against known threats and alerts not only to inbound threats, but also on suspicious outbound activity. Botnets or malicious code propagating from your network can be stamped out immediately.
- Delivers the right information to the right person for the fastest results
- Optimizes operations with effective filters that reduce false positives

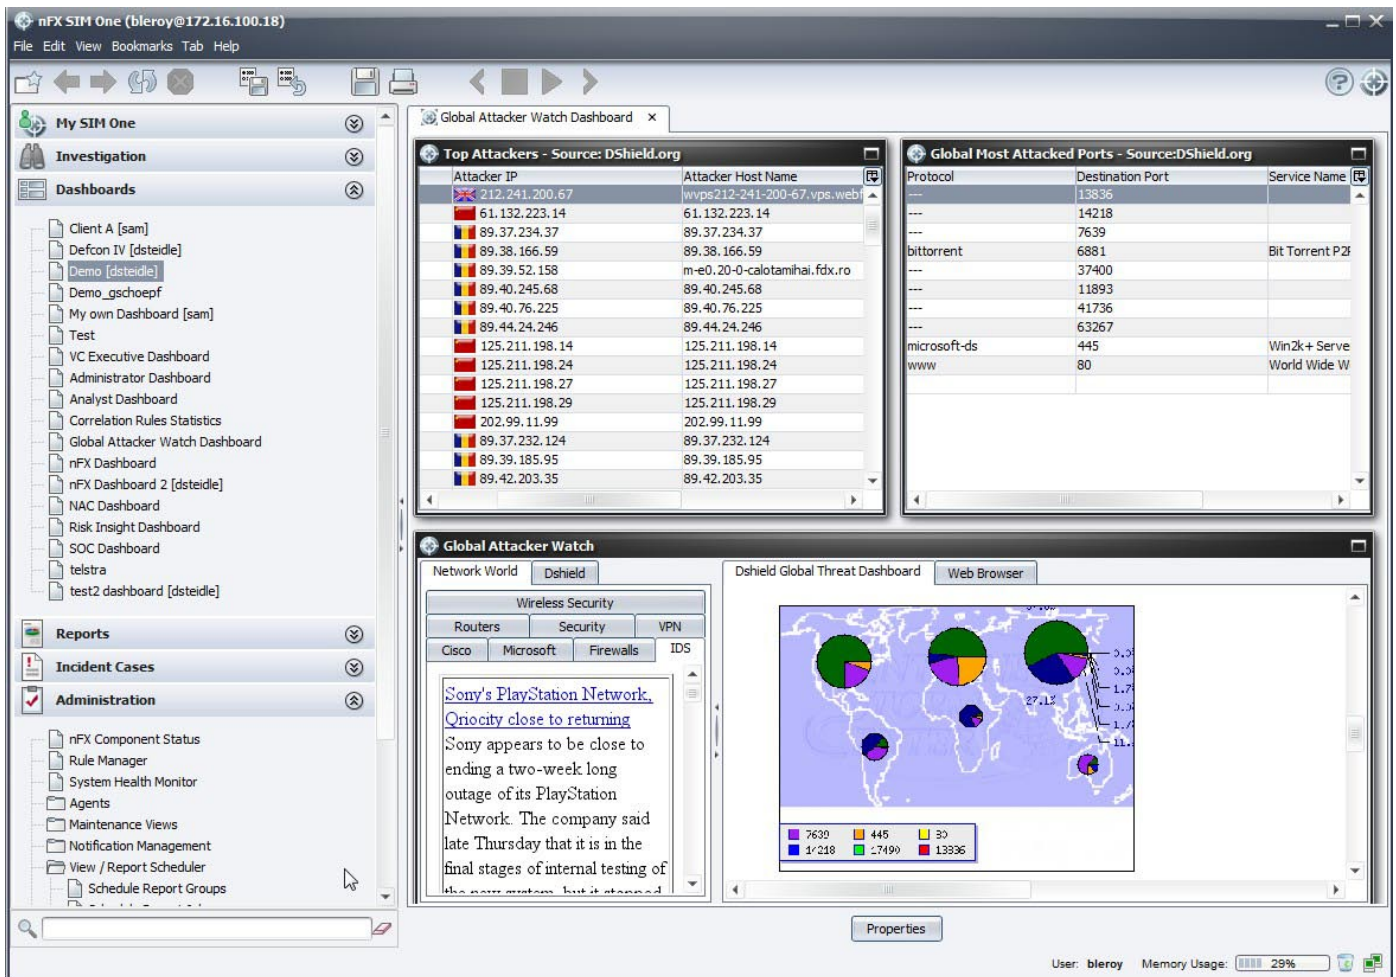

Rule-based Correlation automatically applies conditional logic to identify likely attack scenarios. Once identified, these scenarios can be played out across your customer base to identify those networks in potential danger. SP Detect employs multi-state rules to reduce the number of rules security analysts must write and maintain.

With our **Integrated Security Help Desk Ticketing System**, a fully integrated SANS Six-Step incident response framework guides your team through a proven process to fully eradicate threats. You can easily demonstrate to your customers that incidents are handled with your complete, rigorous processes. Preconfigured incident templates and customizable resolution procedures simplify the incident resolution process. All events related to an incident are tagged for evidence, rapid retrieval and analysis for SLA compliance.

Customer Ready Threat and Operational Reports provide summary views and in-depth insight into malware, botnets and emerging threats and show customers how they were accurately detected, analyzed and mitigated in customer environments. Reports include information on:

- Which attackers attempted access and the related assets that are at risk
- Which systems were compromised by malicious code
- Open cases, how long they have been open, the case owners, and the status of each case
- Time-to-resolution on closed cases

SP Detect provides a deep, intuitive range of visualization and reporting tools to rapidly detect emerging threats, global attacks and malicious code.

nFXpert Services: Accelerating Time-to-Value

SP Detect includes implementation and training services. Our nFX experts will work side-by-side with your team to thoroughly test your new monitoring platform before it ever sees its first customer. Designed to accelerate your new service offerings, we get you up-and-running and delivering reports to your customers fast. Using our best proactive methodologies and expertise, we help you achieve service efficiencies and make sure you have all the tools in place to easily on-board new customers with inside threat and vulnerability reporting.

About netForensics

For over a decade, netForensics security solutions have helped managed service providers, enterprises, and government agencies around the world to manage risk, protect critical assets, and maintain compliant operations. netForensics' nFX One solution suite has been designed to address the unique needs of MSPs by providing flexible, on-demand delivery models that automate threat detection and incident management in high volume, multi-tenant environments. Many of the world's leading service providers rely on netForensics to grow their security business and reduce the cost of providing security-as-a-service.
